Work as a Social Determinant of Health: Theoretical and Practical Considerations

Rada Dagher, Ph.D., M.P.H.
Scientific Program Director, NIMHD

September 28, 2020
Disclaimer

This presentation was prepared by Dr. Rada Dagher in her personal capacity.

The opinions expressed in this presentation are the author's own and do not reflect the views of the National Institutes of Health, the Department of Health and Human Services, or the United States government.
What are Social Determinants of Health?

The conditions in which people are born, grow, live, work and age that shape health (Healthy People 2020).
Work as a Social Determinant of Health (SDOH)

- SDOH include:
  - Socioeconomic status
  - Neighborhood and physical environment
  - Social support networks
  - Access to health care
  - Working conditions
  - Experiences of discrimination/racism

- Work is a multifaceted construct which operates as a SDOH:
  - Source of income
  - Source of health insurance
  - Occupational status/prestige/power
  - Working conditions (exposures), Work-related benefits
  - Social support networks

  ❖ Racism/discrimination may underly the unequal distribution of all of the above
Income Distribution by Gender and Race/Ethnicity in the US

Median usual weekly earnings of full-time wage and salary workers by sex, race, and Hispanic or Latino ethnicity, second quarter 2013

Distribution of Health Coverage by Race/Ethnicity in the US

Health Coverage of Nonelderly Individuals by Race/Ethnicity, 2010

- **White**: 160.6 M
  - Uninsured: 13%
  - Employer/Other Private: 72%
  - Medicaid/Other Public: 15%

- **Black**: 33.0 M
  - Uninsured: 20%
  - Employer/Other Private: 46%
  - Medicaid/Other Public: 34%

- **Hispanic**: 46.9 M
  - Uninsured: 33%
  - Employer/Other Private: 39%
  - Medicaid/Other Public: 29%

- **Asian**: 12.9 M
  - Uninsured: 17%
  - Employer/Other Private: 70%
  - Medicaid/Other Public: 14%

- **AIAN**: 1.8 M
  - Uninsured: 32%
  - Employer/Other Private: 36%
  - Medicaid/Other Public: 32%

- **NHOPi**: 0.4 M
  - Uninsured: 18%
  - Employer/Other Private: 56%
  - Medicaid/Other Public: 26%

Note: Persons of Hispanic origin may be of any race but are categorized as Hispanic for this analysis; other groups are non-Hispanic. Includes nonelderly individuals 0-64 years of age. NHOPi refers to Native Hawaiians and Other Pacific Islanders. AIAN refers to American Indians and Alaska Natives. All values have a statistically significant difference from the White population at the p<0.05 level.

Occupational distribution by race/ethnicity in the US

Employed People by Occupation, Race, and Hispanic or Latino Ethnicity (2016)

Note: People whose ethnicity is identified as Hispanic or Latino may be of any race. Data may not sum to 100 percent because of rounding.
Distribution of Unemployment Rates by Race/Ethnicity

Unemployment Rates by Race, and Hispanic or Latino Ethnicity (2016)

Click legend items to change data display. Hover over chart to view data.
Distribution of Work Benefits by Race/Ethnicity

Latinos least likely to have access to paid sick days or paid parental leave
Percentage of workers age 18 and older with access to paid leave by race and ethnicity, 2011

Glynn & Farrell (November 20, 2012). Center for American Progress
Access to Workplace Flexibility by Race/Ethnicity

Only about half of all workers have access to workplace flexibility
Percentage of workers age 18 and older with access to workplace flexibility by race and ethnicity, 2011

Glynn & Farrell (November 20, 2012). Center for American Progress
### Distribution of Physical Demands by Race/Ethnicity

Relationship between Work Variables and Health

Occupational Status/Prestige:

- The Whitehall study which assessed over 10 years the health and longevity of British civil servants found:
  - at each successive drop in occupational grade level, mortality rates increased (Rossum et al. 2000)

- A U.S. national study found that higher occupational prestige was associated with better self-rated health, controlling for SES, job strain, support, and satisfaction (Fujishiro et al. 2010)

Occupational Segregation:

- Working in segregated occupations was associated with poor self-rated health, even after adjusting for age, gender, income, education, and geographic region (Chung-Bridges et al. 2008)

- Working in an occupation with a higher share of immigrants is associated with higher odds of poor physical and psychological health (Fan & Qian, 2017)
Relationship between Work Variables and Health (cont.)

Work Policies/Benefits:

- Lack of paid sick leave is associated with lower use of recommended cancer screening services, higher likelihood of occupational injuries, and increased duration of flu outbreaks at work (Peipins et al. 2012; Asfaw et al. 2012; Drago et al. 2010).

- Increased duration of paid parental leave has been found to be associated with decreases in perinatal, neonatal, post-neonatal, infant, and child mortality in OECD and non-OECD countries (Heymann et al. 2011; Tanaka, 2005).

- Decreased duration of maternity-leave taking has been associated with higher risk of postpartum depression (Chatterji & Markowitz, 2012; Dagher et al. 2014), reduced breastfeeding initiation and duration (Dagher et al. 2016), lower childhood immunizations, and increases in children’s externalizing behavior problems (Berger et al. 2005).

- Greater levels of job flexibility have been associated with less self-reported stress and strain, and better physical health (Butler et al. 2009, Grzywacz et al. 2008), lower risk of postpartum depression (Dagher et al. 2011), and increased hours of sleep and physical activity (Grzywacz et al. 2007).
Relationship between Work Variables and Health (cont.)

Hazardous Occupational Exposures:

- Attributable fraction for work-related cancer is 8.4% of all cancer deaths (Takala et al. 2012)
- CVD risk factors in the workplace include: arsenic, carbon sulfide, carbon monoxide, methylene chloride, industrial solvents, and lead; excessive heat or cold, noise, and physical exertion (Price, 2004)

Work Organization/Employment conditions:

- Job strain is consistently associated with CVD (Slopen et al. 2012), depression (Hausser et al. 2010, Dagher et al. 2009), and obesity (Choi et al. 2014)
- Heavy physical jobs, more precarious work, limited healthcare benefits linked with higher prevalence of opioid overdose deaths (Shaw et al. 2020)
- Workplace discrimination and precarious employment are linked to poor mental health and problem drinking (Rospenda et al. 2009; van Aerden et al. 2016)
Why is Work an Important Variable in the Study of Health Disparities in the U.S.?

- Vast literature relating work resources and exposures to health
- Profound occupational segregation in the US labor force
- Large disparities in access to beneficial work policies/benefits
- Large disparities in workplace exposures
  - Physical, chemical, biological, and mechanical exposures
  - Psychosocial exposures

- Structural racism/discrimination could be an important mechanism through which work contributes to health disparities
Mechanisms and Pathways Linking Work to Health Disparities

**Occupational Segregation:**
Unequal distribution across occupations according to certain demographic characteristics such as race/ethnicity, gender, immigration status, and others.

**Worksite Segregation:**
Unequal distribution within the workplace according to certain demographic characteristics such as race/ethnicity, gender, immigration status, and others.

**Intergenerational Transmission:**
Transmission of social assets and liabilities from one generation to the next.

**System-level factors:** Upstream policies, system-level trends, bi-directional feedback loops, and systemic patterns that influence the relationship between work and health disparities.

Complexities in studying work and health disparities

- US researchers have mainly used education and income as indicators of SES and rarely occupation (Ahonen et al. 2018)

- Work and health outcomes have a complex relationship as work can be a source of Harmful exposures But also Health-enhancing factors (Ahonen et al. 2018)

- Bi-directionality of the work and health relationship

- Health surveys have scarce data on work and vice versa

- How to conceptualize work
  - What to use: occupation, working conditions, employment relationship, job characteristics, etc. (Ahonen et al. 2018)
  - Tease apart exposures and risk/protective factors, social position/status in society, socioeconomic status

- We need conceptual models, measures, data sources, and analytical approaches to investigate work as an SDOH
Work as a Social Determinant of Health

Demographics
- Education
- Age
- Gender
- Sexual Orientation
- Race/Ethnicity
- Immigration Status
- Language
- Geography (Urban/Rural)
